Cancer is a disease in which the diseased cells exhibit properties of uncontrolled growth. As such, effective diagnosis and therapy are the most important aspects of effective cancer management. In the present study we have evaluated the potential of quantum dots (QDs) for the effective detection and treatment of cancer. We have analyzed biocompatibility of the QDs and the effect of QDs on cancer cell growth. QD conjugates have been synthesized by coupling QDs with specific cancer cell targeted monoclonal antibodies to detect and kill cancer cells. The QD conjugates specifically target the cancer cells and effectively inhibit cancer cell proliferation in a dose dependent manner. This is accompanied by specific death of cancer cells and reduced accumulation of apoptosis in the surviving tumor cells. The QD conjugates do not exhibit any effects on noncancerous cell viability or proliferation. These findings indicate that QDs conjugated with specific antibodies can be used as effective biomarkers and cell specific therapeutics for cancer. QD conjugates may find applications for detection and treatment of a wide variety of cancers including breast, lung, colon and prostate.Fury on the Court Fury on the Court (2000) is a made-for-television legal drama about a woman whose late husband is shot by one of his killer's last legal appeals - a former lover from his teenage years.
