Drivers are always a pain to download and install. How can I change the serial number program?.Q: Powershell Function Composed of Multiple Separate Functions I have a Powershell function in which one of the functions (more specifically, the sort) could potentially change depending on the input to the function. For instance, the code might look something like this: function Get-Data { param(\$Source = [IO.FileInfo]::GetCurrentDirectory() + '\Outputs') # These are unnecessary, but this is just to set up

the example `$objects = Get-ChildItem -Path $Source Sort-Object -Property Name -Descending -InputObject $objects #` And now the main function begins, and perhaps I use a property in the input object `#` to determine which sort operation should be applied. `}` If I wanted to make some sort of test to see if it was possible, how would I go about doing this? In other languages, this sort of thing would be trivial, but I'm not sure that Powershell is this language that can take this approach. A: You can actually have any number of functions within a single function and they won't get mixed up. You can have one function within the function that handles the default case and if a specific function is called, it calls a different function within the function: `function MyFunction { [CmdletBinding()] Param c6a93da74d`
